

Insights

1. Initial Trend - The number of malaria deaths were reportedly rising in Senegal, other than in years 2002 and 2004, from 2000 to 2007. This insight was reached by clicking on Senegal on the map, which displayed deaths due to malaria for each year from 2000 to 2014, then following the bar graph in the right side of the visualization for each reported year, the conclusion was found.

2. Year of Highest Death Rates - The number of malaria deaths in Senegal were greatest in year 2007, during the 2000 – 2014 reporting period. This insight was reached by clicking on Senegal on the map, which displayed deaths due to malaria for each year from 2000 to 2014, then pinpointing the largest bar (greatest data point) reported in the bar chart in the right side of the visualization.

3. Latter Trend - The number of malaria deaths began to rise again in years 2012 and 2013, compared to the immediate year(s) prior, however a significant drop in malaria deaths was reported for 2014, compared to 2013. This may have occurred due to a lapse in diligence and/or a renewed effort to combat malaria (deaths). This insight was reached by clicking on Senegal on the map, which displayed deaths due to malaria for each year from 2000 to 2014, then noticing positive and negative trends/data reported in the later portion of the bar graph in the right side of the visualization.
